Tutorial Proposal
Filterable Drop Down Filter

The component I'd like to make for my tutorial project is a drop down menu that has the ability to be filtered itself via a search bar, and also can filter through an array of objects. This will be very useful for a programmer as it won't limit them to filtering just one type of data or format. For my proof of concept I made the dropdown filter a bunch of images displayed on the screen. The images represent a key/value pair and each element has numerous key/value pairs. The component will be fully reusable allowing for multiple on the screen at the same time all filtering for different things from the same array of objects.
